

Technical Assignment: AI Event Concierge Platform

Role: Full Stack Engineer Intern

Duration: 48 Hours

The Objective

Build a functional "AI Event Concierge" that helps users plan a corporate offsite. The platform should take a natural language description of an event and return a structured, AI-generated venue proposal.

1. Core Requirements (The "Must-Haves")

A. AI Intelligence (Backend)

- Create an API endpoint that takes a user's natural language input (e.g., *"A 10-person leadership retreat in the mountains for 3 days with a \$4k budget"*).
- Use an LLM API (OpenAI or Gemini) to process this and return a **structured JSON response**.
- The response must include: **Venue Name**, **Location**, **Estimated Cost**, and a **"Why it fits"** justification.

B. Data Persistence (Database)

- Store every user request and the corresponding AI suggestion in a database (e.g., Supabase, MongoDB, or Firebase).
- Ensure that when the page is refreshed, previous searches are still visible.

C. The Interface (Frontend)

- **Input:** A clean, minimal search bar or form to describe the event.
 - **Loading State:** A clear "AI is planning..." animation or spinner while the API fetches data.
 - **Results Display:** A dashboard or list showing the current proposal and a history of previous searches in professional cards.
-

2. Evaluation Criteria

- **Full-Stack Flow:** Can your frontend talk to your backend and successfully save/retrieve data?
 - **AI Prompting:** How well did you "instruct" the AI to give consistent, structured data?
 - **UI/UX:** Is the website clean, modern, and easy to navigate?
 - **Deployment:** Is the site live and accessible via a URL?
-

3. Submission Requirements

To be considered for the role, please submit the following:

1. **Active Website Link:** Provide a link to the working, deployed website (e.g., via Vercel, Netlify, or Railway). **Submissions without a working live link will not be reviewed.**
2. **GitHub Repository:** Ensure your code is public and includes a [README.md](#) with instructions on how to run it locally.
